

MessageMag FAQ

- Q.** Can I feed MessageMag through my offset press?
- A.** Yes you can. You will need to mask off all metal parts with chipboard or any material that would create an air gap not allowing the magnet to stick to the metal surfaces. Make sure all taped surfaces are smooth and flat.
- Q.** Will my press feeder pickup and feed MessageMag?
- A.** Yes it will. On some larger sheet sizes it may be necessary to add additional air to allow for better sheet separation. Replace small sheet suckers with larger suckers to ensure good feeding if necessary. Standard feeder setups typically work well.
- Q.** My MessageMag stops at the end of feed table and shows double sheet.
- A.** Most press manufacturers allow you to disable the electronic double sheet sensor and use the mechanical double sheet detector on the feed table. (Consult your press manufacturer)
- Q.** What is the best way to test MessageMag's feeding and printing capabilities?
- A.** Load the feeder and set impression and manual double sheet detector as you would in printing paper. Turn off the impression and start the press to feed sheets. Allow the press to run (not printing) and set up delivery as the heavier sheet might need a slightly different setting to properly jog sheets. With the material feeding and stacking into the delivery turn impression back on and print as you would any paper.
- Q.** Will the weight of MessageMag cause blocking?
- A.** If you experience blocking due to the additional weight of the magnet, try using more offset spray and stacking in smaller lifts.
